

# Segment Trees

ARTHUR CONMY\*†

Think about how to solve one of the below problems perhaps for smaller bounds.

## Problem (Dynamic Range Sum Queries)

Given an array of  $n$  integers  $x_1x_2\dots x_n$ , process  $q$  queries of the following types:

1. Update the value at position  $k$  to  $u$ .
2. Output the sum of values in the range  $[a, b]$ .

The bounds are  $n, q \leq 2 \times 10^5$  and  $x_i, u \leq 10^9$ .

## Problem (LCAs in a Tree)

You are given a tree of  $n$  vertices, rooted at vertex 1. Given  $q$  queries  $u, v$ , for each query output the lowest common ancestor. Again,  $n, q \leq 2 \times 10^5$

The lowest common ancestor of two vertices  $u$  and  $v$  is the lowest vertex that's on the path from 1 to  $u$  and from 1 to  $v$ :

Figure 1: The LCA of vertices 5 and 8 is vertex 2.

†This is based on *Competitive Programmer's Handbook*, <https://cses.fi/book/book.pdf>, Antti Laaksonen.

## Segment Trees

A segment tree is a binary tree such that the nodes on the bottom level of the tree correspond to the array elements, and the other nodes contain information needed for processing range queries<sup>1</sup>.

0	1	2	3	4	5	6	7
5	8	6	3	2	7	2	6

The corresponding segment tree is as follows:

i.e., each vertex has value the sum of the two vertices below it in this case.

**Question.** Can you see how to perform the range and the sum queries given the data structure of this form?

You should be able to see a way to perform both range queries and updates in  $O(\log n)$ . For the Dynamic Range Queries problem this leads to an  $O(n \log n)$  solution! Segment trees often allow us to support both updating and querying efficiently, rather than just one of them.

## Implementation

I'd recommend sticking quite close to the following segment tree implementation, perhaps even memorising the `query` function<sup>2</sup>.

We store the segment tree as an array `tree` of length  $2n$ , where the array is kept in the array `tree[n]`, `tree[n+1]`, ..., `tree[2*n - 1]`, and the indices correspond to the binary tree vertices as shown:

<sup>1</sup>In this section, we assume that the size of the array is a power of two, because it is convenient to build a segment tree for such an array. You might want to think about how we could use a power of two segment tree when our array doesn't have length that's a power of two.

<sup>2</sup>It turns out a more complicated implementation is needed to allow for both range and point updates and queries to be supported; see 'lazy propagation' in *Competitive Programmer's Handbook*. I don't memorise this implementation, but rewrite it, and it takes a fair bit longer for me.

This has the very nice property that where defined, vertex  $i$  has children  $2i$  (which is even) to the left and  $2i + 1$  (which is odd) to the right, and parent  $\lfloor i/2 \rfloor$ .

**Question.** How can we implement the function `void update(int index, int new_value)` that updates a value in our sum segment tree?

It's slightly trickier to implement the sum function<sup>5</sup>:

```

int sum(int a, int b) {
    a += n; b += n;
    int s = 0;
    while (a <= b) {
        if (a%2 == 1) s += tree[a++];
        if (b%2 == 0) s += tree[b--];
        a /= 2; b /= 2;
    }
    return s;
}

```

We can implement the range maximum query for the LCA problem by replacing the `s += tree[a--]` line with `s = max(s, tree[a--])` and similar for the line below.

## Problems

Implement Dynamic Range Sum Queries first: <https://cses.fi/problemset/task/1648>. If you get stuck implementing any part of the segment tree, you should be able to find all the parts needed (and more explanation) in <https://cses.fi/book/book.pdf>.

**Problem. 1:** <https://cses.fi/problemset/task/1749>

**Problem. 2:** <https://cses.fi/problemset/task/1143>

**Problem. 3:** <https://cses.fi/problemset/task/1144>

**Problem. 4:** <https://cses.fi/problemset/task/2206>

**Problem. 5:** <https://codeforces.com/contest/1467/problem/E>

**Problem. 6:** <https://codeforces.com/contest/1195/problem/F>

**Problem. 7:** Statement: <http://www.ioi2013.org/wp-content/uploads/tasks/day2/game/game.pdf> Problem: [https://oj.uz/problem/view/I0I13\\_game](https://oj.uz/problem/view/I0I13_game)

<sup>5</sup>I committed this to memory at first, but so long as you've got the basic structure the checks modulo 2 and whether to increment or decrement should be rederivable, as I can go through.
